

B2B DT : Data Transformation JSON support

User Guide

1. Unzip the downloaded file to any directory you like. The first unzip will contain several .json example files and a CmInternal_JSONImport.zip file.
2. Unzip the CmInternal_JSONImport.zip file to {DT_Install_Dir}/bin/internalServices.
3. Modify the file: {DT_Install_Dir}/autoInclude/system/import.tgp using a text editor and add the following section:

```
// Import JSON Object
instance Import_JSON = IF_INTERNAL_ImporterSetting
{
    input_file_extension = ".*.*";
    input_file_filter = "All Files (*.*)|*.*||";
    gui_caption = "JSON Object";
    gui_description = "Locate a file representative of the full JSON object to
parse";
    workspace_path = "cminternal_JSONImport";           // internal service
}
```

4. Restart DT Studio.
5. Test it out by choosing File->New Project->Import Project->JSON Object and provide an input file containing the JSON Object you would like to transform.

A sample JSON object file named dataevent.json is part of the file you downloaded.
