

Infacompare Documentation

Purpose

The purpose of this utility is to compare an exported XML file from a source repository to a target repository folder. The exported source XML can be anything exported from Designer/Workflow Manager/Repository Manager or pmrep command line. You can compare mappings/sessions/workflows/Deployment groups or folder XML exports. An HTML document is created with all objects from the source XML and defines if there is a conflict or a new object. Radio buttons are added to select whether to replace/reuse the object. The utility also compares any connection objects in the source XML and determines if they exist in the target repository.

Features

- Documents an object conflict before you migrate objects to the target repository
- Documents any missing connection objects before you migrated objects to the target repository
- Simple HTML file that can be modified and printed to add to the migration request.

Prompts

Prompt	Prompt Description/options
-r	target repository_name
-d	target domain_name (-h and -o is not used)
-h	target portal_host_name (-d is not used)
-o	target portal_port_number (-d is not used)
-n	user_name
-s	user_security_domain
-x	password
-f	target folder name
-out	output HTML file name (inc. full path)
-in	full path and file name to source XML

Pcconfig Properties file

Required Properties:

- PC_CLIENT_INSTALL_PATH
- TMPDIR

Properties file definitions

Property Name	Property Description
PC_CLIENT_INSTALL_PATH	Full path to Informatica client bin folder (C:\Informatica\9.1.0\clients\PowerCenterClient\client\bin)
TMPDIR	Full path to temporary folder (C:\Temp)
